

## **WHY IS EVERYONE TALKING ABOUT THIS CAMERA SYSTEM?**

Did you know that the VEI OceanView Apollo is **the most unique entry level night vision camera** in the world?

The Apollo has not one but **TWO CAMERA** sensors built into one. A thermal camera and low light camera are combined into this one sleek unit.

In a typical night travel situation the thermal camera sensor is only used about 70 percent of the time? The other 30 percent of the time a low light camera sensor is more suitable. The problem is this combination of camera sensors has only been found on much more expensive camera systems, we have solved this problem. VEI OceanView has been manufacturing this incredible camera combination for the last six months. The popularity of this product has been nothing short of unbelievable.

Why not have the choice of viewing both of these nighttime images **simultaneously**? Both camera sensors can be shown at the same time on two helm displays or on a split screen. This camera also rotates 360 degrees continuously so you never lose a target.

Its MSRP of only \$12,995 has made the Apollo the camera of choice for cruisers, sportfish, mega yachts and workboats around the globe. Vessels of all types and sizes are enjoying the dual camera sensor configuration, shouldn't you...
